

# TECHLINE CUSTOM ENGINEERED POLE OPTIONS

## All Techline Lighting Systems offer state-of-the-art poles specifically designed to meet your needs

Techline offers concrete-encased galvanized steel, anchor base steel and concrete pole options. Each pole type has advantages depending on the lighting design, application and environment (site conditions).

Concrete encased galvanized steel poles are the most cost effective to deliver and install. Concrete poles are generally the most cost effective in very high wind zones. We will custom engineer the optimum TSL system and pole type for your needs.

Concrete encased poles have been proven as an excellent choice for over 30 years. Each pole is 100% hot-dipped galvanized. (As shown in the photo, a Corrocote-II™ corrosion resistance coating is then added for double protection.

Corrocote-II™ is environmentally friendly with zero VOC's (volatile organic compounds). It is approved by Underwriters Laboratories, the Steel Tank Institute and NSF International.

All Techline poles are manufactured in the United States.

Galvanized steel poles are delivered on Techline trucks direct from our inventory, in most cases.
